Deploying container-based applications on EGI with VIP

Sandesh Patil, Axel Bonnet, Sorină Camarașu-Pop, Tristan Glatard

VIP : Virtual Imaging Platform

- Free and open platform for the simulation and processing of medical images
 - 1400+ registered users;
 - 20+ applications available as a service;
 - Web portal at <https://vip.creatis.insa-lyon.fr/>
- Uses EGI resources from the biomed Virtual Organization to provide users with transparent access to high-throughput computing (through the DIRAC framework).

How it works?

- VIP [ref. 1] relies on Boutiques [ref. 3] to facilitate application deployment and execution on EGI resources. [fig. 1]
- Applications are fully described through Boutiques JSON descriptors.
- Descriptors point to Linux containers to facilitate application installation and sharing.

Containers

- Docker containers are very popular, but the Docker daemon requires root privileges, preventing its support on HPC and HTC infrastructures.
- Singularity answers this problem and thus popular in HPC centers. However, on EGI, it comes in variety of versions and configurations, which might prevent its seamless use.
- Udocker [ref. 2] is another alternative, which can be installed on the fly without root privileges.

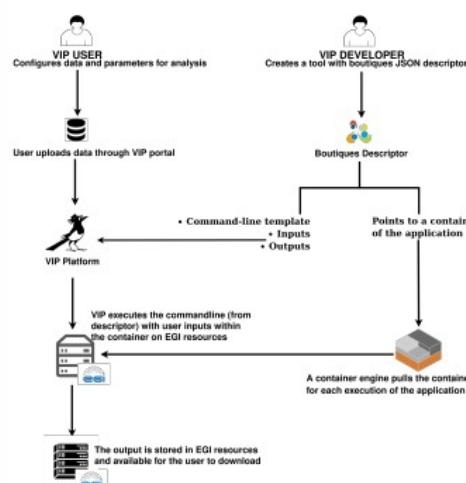

Fig. 1 – VIP relies on Boutiques and Linux containers for application deployment.

Container pre-deployment with udocker on CVMFS

- Udocker can pull the images (udocker pull <image_name>) on the fly from a central hub (e.g docker hub) on the EGI worker nodes [fig. 2]
- However, this may cause network issues for larger number of parallel jobs
- One alternative is to pre-deploy containers on CVMFS (CemVM File System) [ref. 4].
 - The image is pulled from the hub, then converted into a container (udocker create <container_name>).
 - The container is stored on CVMFS shared storage for future usage.
- VIP jobs are then able to use udocker with the pre-deployed containers.

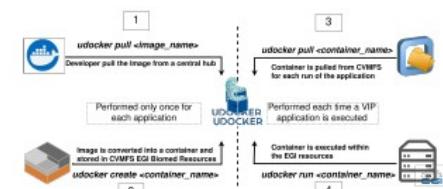

Fig. 2 – Pre-deployment of containers on CVMFS.

Conclusion and perspectives

- VIP is used by more than 1400 users for more than 20 applications of medical simulation and imaging, which are executed on EGI resources using linux containers.
- Containers are managed with udocker, which is deployed on the fly on EGI Worker Nodes.
- For some VIP applications, containers are pre-deployed on CVMFS.
- Pre-deployment of containers on CVMFS for production usage is very useful, but it may be cumbersome for testing and development.
- Having an EGI dedicated container registry could be a good alternative for testing and development usage.

VIP en une phrase

- Portail web
- Pour l'imagerie médicale
- AaaS
- Gratuit (pour la recherche)
- Utilise des ressources d'EGI (VO biomed)

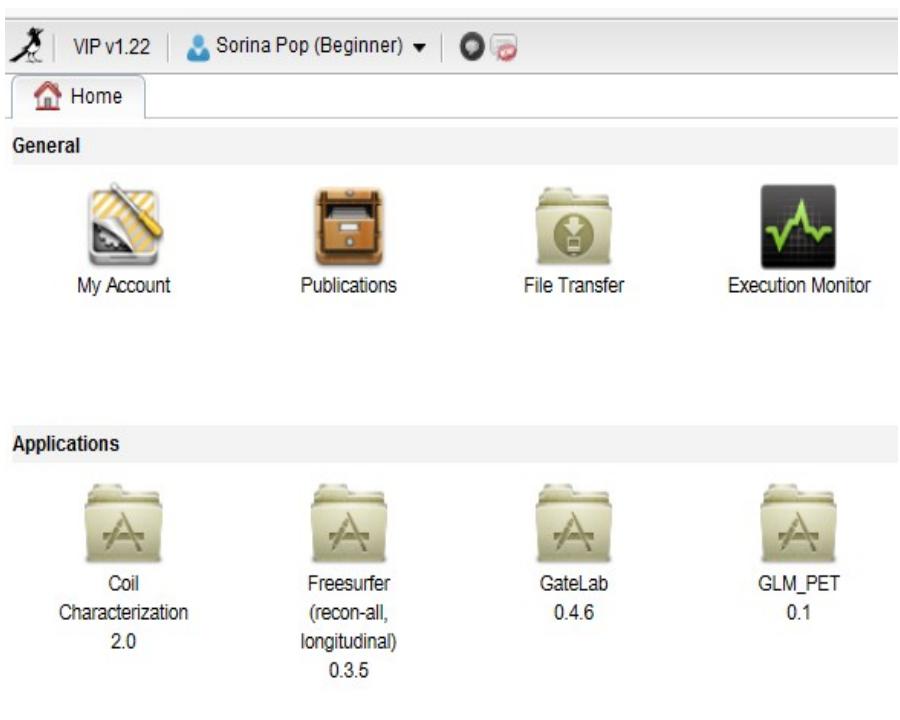

The screenshot shows the VIP v1.22 web interface. At the top, there's a header with the logo, version (VIP v1.22), user profile (Sorina Pop (Beginner)), and some icons. Below the header, the "Home" tab is selected in a navigation bar. The main content area has two sections: "General" and "Applications".
General: Contains four icons: "My Account" (person icon), "Publications" (book icon), "File Transfer" (cloud with download arrow icon), and "Execution Monitor" (line graph icon).
Applications: Contains four application icons with their names and versions:

- Coil Characterization 2.0
- Freesurfer (recon-all, longitudinal) 0.3.5
- GateLab 0.4.6
- GLM_PET 0.1
